

### SK-NET™ Client Server Installation

#### SK-NET-MLD-CSXX (2 to 15 users) Installation:

- 1.0 To install the SK-NET™ Client Server software you should install the ADS software on your network server first. If you are not going to use a network server, then you must select a single workstation to act as a server for the workstations SK-NET™ will be installed on.
  - 1.1 From the CD menu, select “Client Server SK-NET” and then “Install ADS”. The directory where the ADS software is installed must be shared with the network.
  - 1.2 When asked to provide a “serial number” and “validation code” you will find these on the inside cover of your SK-NET™ manual.
  - 1.3 A folder must be created and shared to store all the database files in. This folder must be located on the same drive as the ADS software has been installed. **Example Name: Sknetdata.**

#### SK-NET™ workstation installation:

- 2.0 SK-NET™ can be installed on any workstation on the same network where the ADS software has been installed. You can purchase a license to install SK-NET™ on to a workstation for as many as 2 to 15 workstations.
  - 2.1 From the CD menu select “Client Server SK-Net” and then “New SK-Net Installation”.
  - 2.2 When asked where to install SK-NET™, we recommend that you accept the default location.
  - 2.3 When asked where to “Install SK-Net Database”, browse to the mapped drive and select the database folder you created. **Example: Sknetdata.**
  - 2.4 Complete the installation. Once you start SK-NET™ for each location, verify in the lower right hand corner that it displays “Client Server Version”.
