

RK-HHP

Handheld Programmer - User Guide

The RK-HHP is a handheld programmer for use with Radio Key® standalone access control units: RK-65K, RK-65KS, RK600e and RK-100M. The RK-HHP can be used in place of the RK-PD1 program card deck. Simply hold the RK-HHP in front of, and parallel to the access control unit and press the numeral and function keys for each programming step. Each key press should result in a beep from the access control unit.

The RK-HHP uses passive RFID technology. There are no batteries to change and it is not necessary to “aim” the programmer at a particular part of the access control unit.

For your convenience, two peel-and-stick quick-guides have been provided. You may attach one of these guides to the back of the RK-HHP for easy reference. For complete programming instructions, see the manual provided with the access control unit.

Note: the programming instructions for the RK-65K and RK-65KS are different than those for the RK-600e and RK100M.
